Corrections? 'webmasterA' @
www.RexxInfo.org. Thanks!

Based on the ANSI-1996 standard.

Operators

Operators are listed in precedence order, from highest to lowest. Operators from the same grouping are evaluated left to right.

<code>\</code>	<code>¬</code>	Logical NOT (as a prefix)
<code>+</code>		Indicates a positive number (as a prefix)
<code>-</code>		Indicates a negative (as a prefix)
<code>**</code>		Raise to a whole number power
<code>*</code>		Multiply
<code>/</code>		Divide
<code>%</code>		Integer divide (return integer part)
<code>//</code>		Remainder divide (return remainder)
<code>+</code>		Add
<code>-</code>		Subtract
<code> </code>	(abuttal)	Concatenate (with no space)
(blank)		Concatenate with blank in-between
<code>==</code>		Strictly equal
<code>¬==</code>	<code>\==</code>	Not strictly equal
<code>>></code>		Strictly greater than
<code><<</code>		Strictly lesser than
<code>>>=</code>	<code>¬<<</code> <code>\<<</code>	Strictly greater than or equal to (strictly not less than)
<code><<=</code>	<code>¬>></code> <code>\>></code>	Strictly less than or equal to (strictly not greater than)
<code>=</code>		Equal to (also used for assignment)
<code>¬=</code>	<code>\=</code>	Not equal to
<code><></code>	<code>><</code>	
<code>></code>		Greater than
<code><</code>		Less than
<code>>=</code>	<code>¬<</code> <code>\<</code>	Greater than or equal to (not less than)
<code><=</code>	<code>¬></code> <code>\></code>	Less than or equal to (not greater than)
<code>&</code>		And (both are true)
<code> </code>		Or (either is true)
<code>&&</code>		Exclusive Or (either but not both are true)

Notes: not all implementations support all notations (for example: `¬`). You can always ensure a higher precedence for a clause by enclosing it in parentheses: `()` .

Syntax

Symbols include:	A-Z, a-z, 0-9, ? ! _ (many implementations add @ # \$ % .)
<code>;</code> (semi-colon)	Statement separator
<code>,</code> (comma)	Continues a line
<code>/* */</code>	Encloses comments
<code>()</code>	Enclose function arguments, or groups for precedence
<code>symbol = expression ;</code>	Assignment of value to variable
<code>stem.tail</code>	Compound variable (tail may be multiple simple symbols separated by periods)
<code>stem.index</code>	Simulating arrays with compound variables
<code>'abc'</code> or <code>"abc"</code>	Character string notation
<code>'0c'x</code> or <code>"0c"x</code>	Hexadecimal notation
<code>'0101'b</code> or <code>"0101"B</code>	Binary string notation

Exceptions

NOVALUE	Reference to an uninitialized variable
ERROR	Command to external environment indicates error
FAILURE	Command to external environment failed
HALT	External interrupt to the script (such as a Ctrl+C)
NOTREADY	Unready I/O device
SYNTAX	Syntax or runtime error in the script
LOSTDIGITS	Arithmetic operation lost digit(s)

Flow of Control

IF-THEN	IF-THEN-ELSE	SIGNAL
SELECT	CALL	LEAVE
RETURN	EXIT	ITERATE
DO-END group	DO-WHILE	
DO n times	DO-UNTIL	
DO initialize-loop-counter TO limit BY increment		

Help

Forum: <https://groups.io/g/rexxla-members>

Websites: www.RexxInfo.org www.RexxLA.org

Instructions

= (assignment) symbol = expression ;

ADDRESS | environment [command] [redirection] |
| [VALUE] expression [redirection] |

redirection is: WITH INPUT input_redirection
and/or: WITH OUTPUT output_redirection
and/or: WITH ERROR output_redirection

input_redirection is: [NORMAL | STREAM | STEM] symbol

output_redirection is: [APPEND | REPLACE]
plus a destination: [NORMAL | STREAM | STEM] symbol

ARG [template] → see **HINTS** for [template]

| name [expression] [, [expression]] . . . |
CALL | ON condition [NAME trapname] |
| OFF condition |

DO [repetitor] [condition]
[instruction_list]

END [symbol]

repetitor is either: symbol = expression_i [TO expression_t]
[BY expression_b] [FOR expression_f]
or: expression_r
or: FOREVER

condition is either: WHILE expression_w
UNTIL expression_u

DROP symbol [symbol ...]

EXIT [expression]

IF expression [,] THEN [,] instruction [ELSE [,] instruction]

INTERPRET expression

ITERATE [symbol]

LEAVE [symbol]

NOP

NUMERIC DIGITS [expression]
FORM [SCIENTIFIC | ENGINEERING |
[VALUE] expression]
FUZZ [expression]

OPTIONS expression

PARSE [UPPER] type [template] → see **HINTS** for [template]

type is: [ARG | LINEIN | PULL | SOURCE | VERSION]
or: VALUE [expression] WITH
or: VAR symbol

PROCEDURE [EXPOSE variable_list]

PULL [template] → see **HINTS** for [template]

PUSH [expression]

QUEUE [expression]

RETURN [expression]

SAY [expression]

SELECT ; when_part [when_part ...] [OTHERWISE [,]
[instruction_list ...]] END ;

when_part is: WHEN expression [,] THEN [,] instruction

| label_name |
SIGNAL | [VALUE] expression |
| ON condition [NAME trapname] |
| OFF condition |

TRACE trace_setting | [VALUE] expression

A -- All

C -- Commands

E -- Errors

F -- Failure

I -- Intermediates

L -- Labels

N -- Normal

O -- Off

R -- Results

? -- Toggles interactive trace On or Off

(? can be followed by a letter from the above list)

+n -- Skips number of pauses specified by whole number

-n -- Inhibits trace for number of clauses specified

Hints

Character I/O – CHARS([name] [,option])
CHARIN([name] [,start] [,length])
CHAROUT([name] [,string] [,start])

Line I/O – LINES([name] [,option])
LINEIN([name] [,line] [,count])
LINEOUT([name] [,string] [,line])

Conversational I/O – PULL [template]
PARSE PULL [template]
SAY [expression]

Concatenation – apple='-Apple'
say 'Candy'apple outputs: Candy-Apple
say 'Candy' apple Candy -Apple
say 'Candy' || apple Candy-Apple
say 'Candy' apple Candy -Apple

Parsing for the ARG, PARSE, and PULL [template] –
by Words (strings separated by blanks or spaces)
by Delimiters (delimiters identify input data elements)
by Numbers (for starting or relative column positions)
→ Periods can be used to skip or exclude data elements

Examples: phone = '212-855-1212' ; sep = '.' ;
parse value phone with area_code (sep) prefix (sep) number
parse value phone with area_code 4 5 prefix 8 9 number
parse value phone with area_code +3 +1 prefix +3 +1 number
parse value phone with 4 sep +1 . 1 area (sep) prefix (sep) numb
parse value phone with . (sep) prefix (sep) . → returns prefix
parse value phone with +8 number → returns number
parse value phone with =9 number → returns number

Functions

Options for Functions

Date	Time	Datatype
B Base	C Civil	A Alphanumeric
D Days	E Elapsed	B Binary
E European	H Hours	L Lowercase
M Month	L Long	M Mixed case
N Normal	M Minutes	N Number
O Ordered	N Normal	S Symbol
S Standard	R Reset	U Uppercase
U USA	S Seconds	W Whole #
W Weekly		X Hex

Special Variables

RC Return code from a command, or a SYNTAX error code

SIGL Line number of last instruction that caused a jump to a label

RESULT Set by a RETURN instruction in a subroutine
